

A12 E-Commerce Showcase

Fact Sheet

The A12 E-Commerce Showcase is a hands-on demonstration of A12. It illustrates how retailers can use A12 to build their own online shop and benefit from the versatility that low-code offers in development. A12 simplifies the modelling of data and forms (e.g. customer orders) and is equipped with a variety of features, such as a live preview of the modelled form. In this demonstration, we assume a typical company that offers various products from different categories. This will give you a clear insight into the variety of functions that A12 offers for the e-commerce sector.

The applied examples of the A12 tools presented in the showcase include:

- Validation rules e.g. for mandatory fields, minimum values, unique entries etc.
- Calculations e.g. combining an ERP number with a variant number, calculating discounts in per cent etc
- Expressions e.g. to generate and concatenate information about product variants, such as selected attributes
- Dependent fields e.g. to define fields as editable or read-only depending on checkboxes
